

# Unemployment and Vacancies in Turkey: The Beveridge Curve and Matching Function

Birol Kanık, Enes Sunel and Temel Taşkın

The Central Bank of the Republic of Turkey

Sep 10, 2013 (BETAM)

The views expressed in this presentation are those of the authors and do not represent the official views of the Central Bank of the Republic of Turkey.

## The goal of the paper:

- To examine the relationship between unemployment and vacancies within the context of the Beveridge curve and Matching Function for Turkey.
- To investigate the compliance of these two labor market indicators of Turkish economy with the well documented characteristics of the relationship between unemployment and vacancies in the existing labor economics literature.

- We find that Turkish Beveridge Curve depicts a negative relationship between vacancies and unemployment as theory suggests.
- The unemployment-vacancies pairs are found to follow a counterclockwise trajectory around the empirical Beveridge curve.
- The estimated Matching Function shows a positive relationship between job finding rate and tightness of labor market.
- The parameters of the estimated matching function are found to be different for different data sets (Kariyer.net vs. Turkish Employment Agency (TEA)).
- Disaggregated Beveridge curve shows different patterns for different types of unemployed.

## Outline of the presentation

- 1 Theoretical Background
- 2 Empirical Literature
- 3 Data
- 4 Turkish Beveridge Curve and Matching Function
- 5 Disaggregated Beveridge Curve
- 6 Conclusion

# Beveridge Curve Theoretical Background

First approach: Disequilibrium

Disequilibrium in segmented labor markets: real wage rigidities  
Dow and Dicks-Mireaux (1958), Lipsey (1960) and Hansen (1970)

# Beveridge Curve Theoretical Background

## Second Approach: Search and Matching Framework

- Diamond-Mortensen-Pissarides (DMP) model

$$m(U_t, V_t) = \mu U_t^\alpha V_t^\beta \quad \text{where } \mu, \frac{dm}{dU} \text{ and } \frac{dm}{dV} \geq 0, \quad (1)$$

$$\frac{dU_t}{dt} = s \times (1 - U_t) - m(U_t, V_t), \quad (2)$$

Long run equilibrium:  $U_t = U$ ,  $V_t = V$  and  $m(U_t, V_t) = m(U, V)$ ,

$$U = 1 - \frac{m(U, V)}{s} \quad (\text{Beveridge Curve}) \quad (3)$$

# Empirical Literature

## Beveridge Curve

- **US:** Blanchard and Diamond (1989), Valetta (2005), Cotti and Drewianka (2007), Hobijn and Sahin (2012).
- **Britain:** Jackman et al.(1989) and Wall and Zoega(1997).
- **Canada:** Samson (1994).
- **Sweden:** Edin and Holmlund (1991).
- **Turkey:** Bayraktar-Saglam and Gunalp (2012).

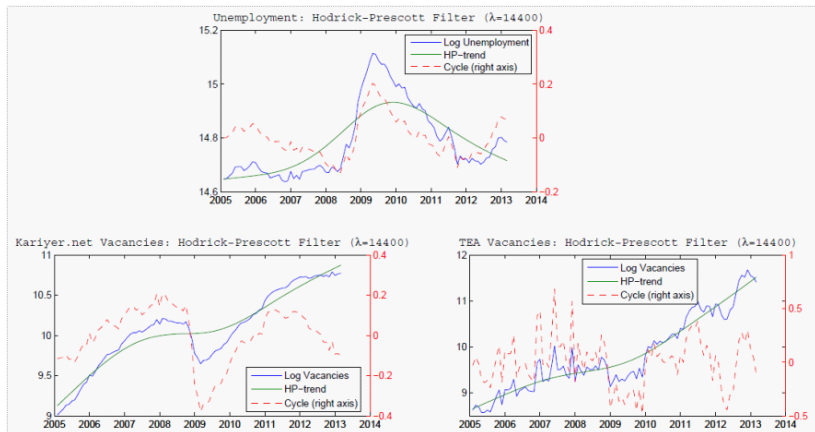

- Blanchard and Diamond (1989), NBER
- Pissarides (1986), Coles and Smith (1996)
- Shimer (2005, 2007)
- Burda and Wyplosz (1994)
- Anderson and Burgess (2000)
- Warren (1996)

# Unemployment and Vacancies

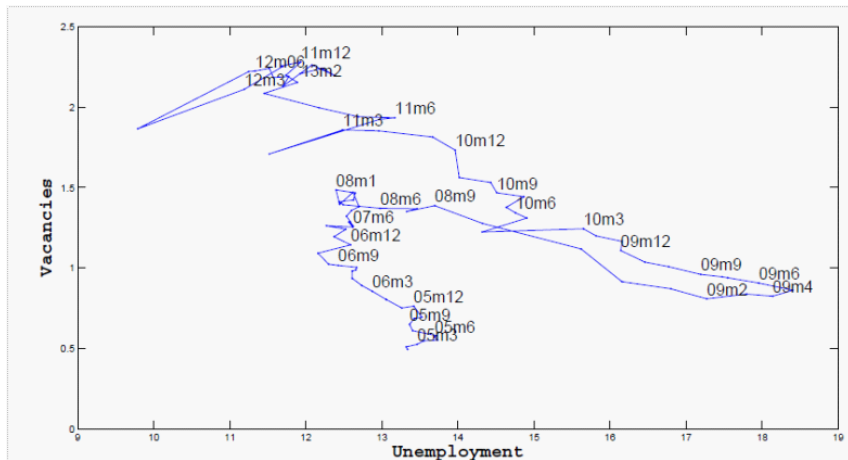

## Data

Non-farm unemployment rate (TURKSTAT), kariyer.net vacancies, Turkish Employment Agency (TEA) vacancies, 2005 M1-2013 M2, job finding rates, Sengul (2012)

# Unemployment and Vacancies

Turkish Beveridge Curve in levels with Kariyer.net Data

# Unemployment and Vacancies

Turkish Beveridge Curve with Kariyer.net Data-Detrended

# Unemployment and Vacancies

## Turkish Beveridge Curve

- We find that Turkish Beveridge Curve depicts a negative relationship between vacancies and unemployment as theory suggests.
- The unemployment-vacancies pairs are found to follow a counterclockwise trajectory around the empirical Beveridge curve.

# Unemployment and Vacancies

## Matching Function

$\frac{m(U,V)}{U}$  = job finding rate     $\frac{m(U,V)}{V}$  = vacancy yield

$$\frac{m(U_t, V_t)}{U_t} = f_t = \mu \left( \frac{V_t}{U_t} \right)^{1-\alpha}, \quad (4)$$

$$\frac{\partial f_t}{\partial U_t} \frac{U_t}{f_t} = \alpha - 1 < 0 \quad (\text{congestion effect}) \quad (5)$$

$$\frac{\partial f_t}{\partial V_t} \frac{V_t}{f_t} = 1 - \alpha > 0 \quad (\text{spillover effect of vacancies}) \quad (6)$$

$$\log f_t = \log \mu + (1 - \alpha) \log \left( \frac{V_t}{U_t} \right)$$

# Unemployment and Vacancies

Matching Function with HP detrended series

# Unemployment and Vacancies

## Matching Function Estimation for Turkey

Dependent Variable (job finding rate)	Vacancies/Unemployment (V/U)	$\bar{R}^2$
Kariyer.net (2006-2012)	0.20 (0.04)***	0.86
TEA (2005-2013:M2)	0.54 (0.05)***	0.72

Values in parenthesis represent standard errors.

\*\*\* implies significance at 0.01 level

# Unemployment and Vacancies

## Matching Function Estimation for Turkey

- The estimated Matching Function shows a positive relationship between job finding rate and tightness of labor market.
- The parameters of the estimated matching function are found to be different for different data sets we use Kariyer.net vs Turkish Employment Agency.
- Negative congestion effect of the pooled of unemployed is higher in TEA data.

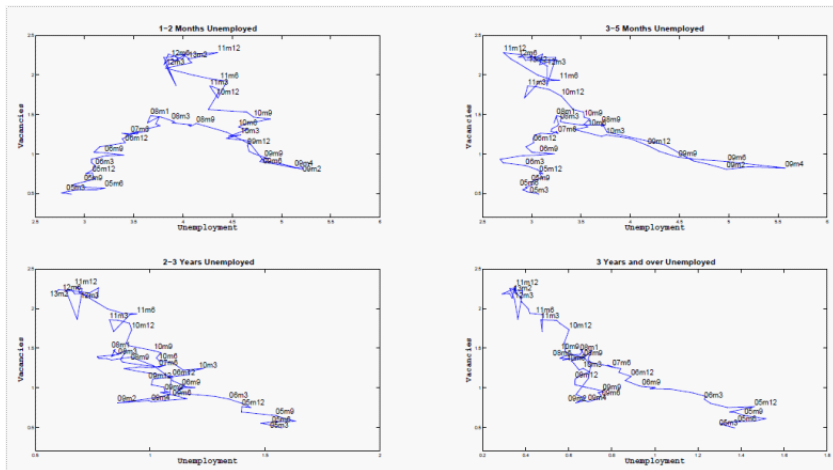

# Disaggregated Beveridge Curve

## Reason of Unemployment

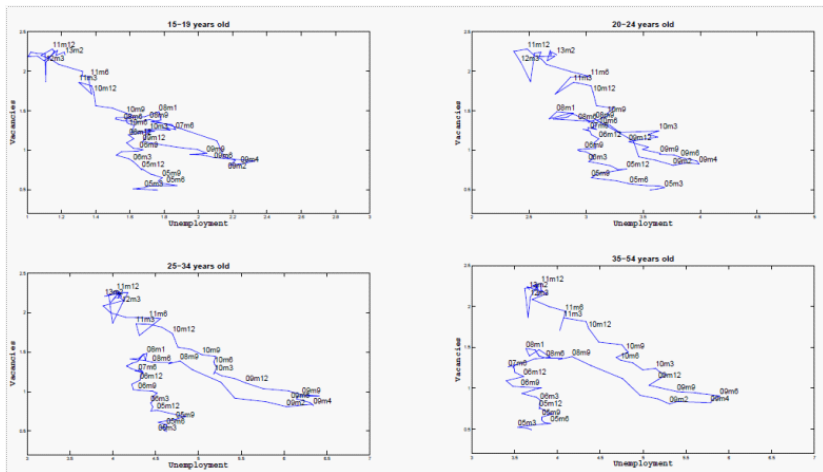

# Disaggregated Beveridge Curve

## Unemployment Duration

# Disaggregated Beveridge Curve

## Age of Unemployment

# Disaggregated Beveridge Curve

## Gender of Unemployed

# Conclusion

- Disaggregated Beveridge curve shows different patterns for different types of unemployed.
- We find that Turkish Beveridge Curve depicts a negative relationship between vacancies and unemployment as theory suggests.
- The unemployment-vacancies pairs are found to follow a counterclockwise trajectory around the empirical Beveridge curve.
- The estimated Matching Function shows a positive relationship between job finding rate and tightness of labor market.
- The parameters of the estimated matching function are found to be different for different data sets we use Kariyer.net vs Turkish Employment Agency

# Conclusion

- Thank you!!

# Unemployment and Vacancies

Turkish Beveridge Curve with TEA Data
